The book “Catalytic Process Development for Renewable Materials” has been compiled by the two editors Pieter Imhof and Jan Cornelis van der Waal both of whom have industrial catalytic experience (Avantium, Shell, Akzo-Nobel and Albermarle). One is a chemist experienced in parallel catalyst screening and the other is a chemical engineer, experienced with large-scale feedstock processing, including the respective biomass processes. Obviously, this is a good combination. The Preface is written by the CTO of Royal Dutch Shell, Jan van der Eijk, on the Next Feedstock Transition which shows the general focus of the book and shows the reader that this is a very relevant topic for global players and society in general. The editors have chosen authors or teams of authors for the single book chapters and the selection is a nice mixture between academia, public organizations and industry, involving on the public organization and industry side, authors from Statoil, LLC, Amyris, Baschem, Johnson Matthey, Lignol Innovations, and diverse US National Departments. Most of the writers come from North America (US, Canada), South America (Brazil) and Europe with a focus on the Netherlands. No authors from Asia or Australia are involved. Yet, the book can be considered to aim at a condensed “world view”.

A first look at the content list shows that the chapters are well structured and that the reader gets much information. Since the whole biomass topic comprises a myriad of information and subtopics, we expected such massive load of information; basically this is a new chemistry that shares all the facets of the existing one. It is certainly a hard job to condense that into one book and the authors have succeeded here. The next question then is this biomass book different from all the many, many others (especially those of the good Wiley-VCH series) mentioned as “Related Titles” in the beginning of the book. I have seen only a few of them, which limits my judgment here.

What can be said is that this book has its own original, authentic flavor which has been sketched already and which lies further in the fact that it is devoted to catalytic process development. The book opens with the first two chapters devoted to catalytic process development which is then expanded on in chapters 6 to 13. In between, two chapters are concerned with two very essential chemical synthetic pathways, terpenes and carbohydrates. There is a chapter on the use of the parallel screening reactor technology, which relates back to the catalyst mission of the book and the professional experience of the two editors. Thus, the book nicely and holistically moves through chemical pathways, novel reactors, testing protocols, full process implementation and ends with life cycle assessments. Coming back to the initial question, it is now clear “yes” – this book is different and it is worth buying, even if one has already a larger selection of biomass related books. The book’s main focus is on process development (with the exception of the chapter 5) and naturally nearly all the processes involved comprise and depend on catalysts. Yet, seeing that virtually all subtitles refer to the materials, reactors or processing, the catalytic aspect of the process development is more “served” inherently and consistently than as separate and distinctive idea. This may be worth considering for a second issue of the book.

Chapters 1 and 2 are a good beginning as they give a good overall picture. Chapter 1 “The Renewable Area” is written by the editors and shows great scientific competency in covering the main players and molecules in the catalytic processes. A lot of inside information is given; at least for those interested in applied chemistry. Chapter 2 “Selecting Targets” deals with the essential platform molecules and main pathways and focuses not only on a few industrially implemented roots but aims to give the comprehensive opinions of industrial and interest groups. We learn that these changes will take place over the next 10 years or so and the validity of some information of the book will depend somewhat on such change. But this is inherent on the dynamic biomass development and any book in the field suffers somewhat from this. Most books need to be updated after 10 years. Chapter 2 repeats some of the information of chapter 1, yet this is inherent to this multifaceted subject and is by no means a criticism. On
