1 vs. 3:	2.40	1	2.60	0.40	0.3712
2 vs. 3:	13.80	1	2.60	5.34	0.0002

(b) Use Tukey's test to compare pairs of treatment means. Use $\alpha = 0.01$.

$$S_{\bar{Y}_i} = \sqrt{\frac{MSE}{n}} = \sqrt{\frac{1690}{5}} = 1.8385$$

$$q_{0.01, 1, 10} = 5.04$$

$$L_0 = 1.8385(5.04) = 9.266$$

$$1 \text{ vs. } 2: |10.8 - 22.2| = 11.4 > 9.266$$

$$1 \text{ vs. } 3: |10.8 - 8.4| = 2.4 < 9.266$$

$$2 \text{ vs. } 3: |22.2 - 8.4| = 13.8 > 9.266$$

1 and 2 are different, 2 and 3 are different.

Notice that the results indicate that the mean of treatment 2 differs from the means of both treatments 1 and 3, and that the means for treatments 1 and 3 are the same. Notice also that the Fisher LSD procedure (see the computer output) gives the same results.

(c) Use the graphical procedure in Section 3-5.3 to compare the treatment means. What conclusions can you draw? How do they compare with the conclusions from part (a).

The scaled- t plot agrees with part (b). In this case, the large difference between the mean of treatment 2 and the other two treatments is very obvious.

(d) Construct a set of orthogonal contrasts, assuming that at the outset of the experiment you suspected the response time of circuit type 2 to be different from the other two.

$$H_0 = \mu_1 - 2\mu_2 + \mu_3 = 0$$

$$H_1 = \mu_1 - 2\mu_2 + \mu_3 \neq 0$$

$$C_1 = y_1 - 2y_2 + y_3$$

$$C_1 = 54 - 2(111) + 42 = -126$$

Scientific and Technical Aerospace Reports, 1995 *Process Planning Optimization in Reconfigurable*

Manufacturing Systems Farayi Musharavati, 2010-09 Trends and perspectives in dynamic environments point towards a need for optimal operating levels in reconfigurable manufacturing activities Central to the goal of meeting this need is the issue of appropriate techniques for manufacturing process planning optimization in reconfigurable manufacturing i.e. i) what decision making models and ii) what computational techniques provide an optimal manufacturing process planning solution in a multidimensional decision variables space Conventional optimization techniques are not robust hence they are not suitable for handling multidimensional search spaces On the other hand process planning optimization for reconfigurable manufacturing is not amenable to classical modeling approaches due to the presence of complex system dynamics Therefore this study explores how to model reconfigurable manufacturing activities in an optimization perspective and how to develop and select appropriate non conventional optimization techniques for reconfigurable process planning In this study a new approach to modeling Manufacturing Process Planning Optimization MPPO was developed by extending the concept of manufacturing optimization through a decoupled optimization method The uniqueness of this approach lies in embedding an integrated scheduling function into a partially integrated process planning function in order to exploit the strategic potentials of flexibility and reconfigurability in manufacturing systems Alternative MPPO models were constructed and variances associated with their utilization analyzed Five Alternative Algorithm Design Techniques AADTs were developed and investigated for suitability in providing process planning solutions suitable for reconfigurable manufacturing The five AADTs include a variant of the simulated annealing algorithm that implements heuristic knowledge at critical decision points two cooperative search schemes based on a loose hybridization of the Boltzmann Machine algo *Engineering*, 1925
