Additions to and substitutions at C-C[pi]-Bonds Barry M. Trost, 1991 Volume 4 focuses on additions and the resulting substitutions at carbon carbon bonds Part 1 includes processes generally considered as simple polar reactions reactive electrophiles and nucleophiles adding to alkenes and alkynes A major topic is Michael type addition to electron deficient bonds featured in the first six chapters In part 2 are collected the four general processes leading to nucleophilic aromatic substitution including radical chain processes and transition metal activation through to complexation Metal activated addition generally by nucleophiles to alkenes and polyenes is presented in part 3 including allylic alkylation catalyzed by palladium The coverage of nonpolar additions in part 4 includes radical additions organometal addition Heck reaction

Carbon-Carbon π -Bond Formation G. Pattenden, 1992-09-08 Volume 3 covers carbon to carbon single bond forming reactions involving sp^3 , sp^2 and sp carbon centers but only those which do not involve additions to C-X bonds. The volume first compares and contrasts the alkylation reactions of all types of sp^3 carbon nucleophiles and also covers vinyl and alkynyl carbanions. Following on from Volume 2 a separate section covers Friedel-Crafts alkylation reactions which is complemented by discussions of polyene cyclizations and electrophilic transannular cyclizations in synthesis. Coupling reactions leading to bond formation and involving all types of combinations of sp^3 , sp^2 and sp carbon centers are next covered including those reactions based on pinacol boron and phenol oxidative coupling reactions and also the Kolbe reaction. Rearrangement reactions leading to carbon to carbon bond formation are often used in a clever manner in synthesis. The volume includes all those rearrangement reactions based on intermediate carbonium ions and carbanions and also includes the benzil benzilic acid and the Wolff rearrangements. The volume closes with coverage of carbonylation reactions and the use of carbene insertion reactions into the C-H bond in synthesis.

Organic Mechanisms Reinhard Bruckner, 2010-04-30 Much of life can be understood in rational terms if expressed in the language of chemistry It is an international language a language without dialects a language for all time a language that explains where we came from what we are and where the physical world will allow us to go Chemical Language has great esthetic beauty and links the physical sciences to the biological sciences from The Two Cultures Chemistry and Biology by Arthur Kornberg Nobel Prize in Physiology and Medicine 1959 Over the past two centuries chemistry has evolved from a relatively pure disciplinary pursuit to a position of central importance in the physical and life sciences More generally it has provided the language and methodology that has unified integrated and indeed molecularized the sciences shaping our understanding of the molecular world and in so doing the direction development and destiny of scientific research The language of chemistry referred to by my former Stanford colleague is made up of atoms and bonds and their interactions It is a system of knowledge that allows us to understand structure and events at a molecular level and increasingly to use that understanding to create new knowledge and beneficial change The words on this page for example are detected by the eye in a series of events now generally understood at the molecular level
