

CARDIAC CATHETERIZATION

Definition

Cardiac Catheterization is a special study of the heart and the blood vessels that supply blood to the heart muscle. During a cardiac cath a long thin flexible catheter, is inserted into an artery or vein in the groin or arm. While watching the catheter on x-ray, the catheter is then passed through the artery or vein to the heart. Once the catheter is in place, pressures in the heart are measured. An x-ray angiogram (motion picture x-ray) of the heart and blood vessels is taken. This is done while injecting an iodinated colorless "dye" or contrast material through the catheter. An angiogram of the coronary arteries is obtained by injecting the contrast material into the opening of a coronary artery. X-ray movies are taken during the injection of the contrast material allowing the blood flow through the coronary arteries to be visualized.

Risk & complication

- Allergic reactions to the contrast or medication
- Bleeding
- Heart Attack
- Stroke
- Kidney Damage
- Infection
- Bruising at the puncture site
- Irregular heart rhythms
- Blood Clots
- Damage to the artery wall and where the catheter was inserted
- Damage to the heart tissue

Planning Ahead

- You will be scheduled to see the cardiologist before the procedure. The doctor will give you instructions for preparation and review risks involved with the procedure. Please ask questions if you don't understand.
- Inform your doctor of all the medicines you take, including all over the counter medications and vitamin supplements. Inform your doctor if you take any oral medicines or insulin for diabetes. Inform your doctor if you are allergic to iodine or radio contrast ("X-Ray dye").
- A nurse will call you within 2 days before the scheduled procedure to give you specific instructions and to answer any questions.
