Categories Allegories Volume 39 North Holland Mathematical Library:

Categories, Allegories P.J. Freyd, A. Scedrov, 1990-11-08 General concepts and methods that occur throughout mathematics and now also in theoretical computer science are the subject of this book. It is a thorough introduction to Categories emphasizing the geometric nature of the subject and explaining its connections to mathematical logic. The book should appeal to the inquisitive reader who has seen some basic topology and algebra and would like to learn and explore further. The first part contains a detailed treatment of the fundamentals of Geometric Logic which combines four central ideas: natural transformations, sheaves, adjoint functors, and topoi. A special feature of the work is a general calculus of relations presented in the second part. This calculus offers another, often more amenable, framework for concepts and methods discussed in part one. Some aspects of this approach find their origin in the relational calculi of Peirce and Schroeder from the last century and in the 1940s in the work of Tarski and others on relational algebras. The representation theorems discussed are an original feature of this approach.

A First Course in Category Theory Ana Agore, 2023-12-12 This textbook provides a first introduction to category theory, a powerful framework and tool for understanding mathematical structures. Designed for students with no previous knowledge of the subject, this book offers a gentle approach to mastering its fundamental principles. Unlike traditional category theory books which can often be overwhelming for beginners, this book has been carefully crafted to offer a clear and concise introduction to the subject. It covers all the essential topics including categories, functors, natural transformations, duality, equivalence, co-limits, and adjunctions. Abundant fully worked examples guide readers in understanding the core concepts, while complete proofs and instructive exercises reinforce comprehension and promote self-study. The author also provides background material and references, making the book suitable for those with a basic understanding of groups, rings, modules, topological spaces, and set theory. Based on the author's course at the Vrije Universiteit Brussel, the book is perfectly suited for classroom use in a first introductory course in category theory. Its clear and concise style, coupled with its detailed coverage of key concepts, makes it equally suited for self-study.

Theoretical Aspects of Computing - ICTAC 2016 Augusto Sampaio, Farn Wang, 2016-10-17 This book constitutes the refereed proceedings of the 13th International Colloquium on Theoretical Aspects of Computing (ICTAC 2016) held in Taipei, Taiwan, in October 2016. The 23 revised full papers presented together with two short papers, two invited papers, and one abstract of an invited paper were carefully reviewed and selected from 60 submissions. The papers are organized in topical sections on program verification, design, synthesis, and testing, calculi, specifications, composition, and transformation, automata, temporal logics, tools, and short papers.

Algebraic and Coalgebraic Methods in the Mathematics of Program Construction Roland Backhouse, Roy Crole, Jeremy Gibbons, 2003-07-31 Program construction is about turning specifications of computer software into implementations. Recent research aimed at improving the process of program construction exploits insights from abstract algebraic tools such as lattice theory, fixpoint calculus, universal algebra, category theory, and allegory theory. This textbook
