Computational Neuroscience In Epilepsy Hardcover 2008 By Ivan Soltesz editor:

Computational Neuroscience in Epilepsy Ivan Soltesz, Kevin Staley, 2011-09-02 Epilepsy is a neurological disorder that affects millions of patients worldwide and arises from the concurrent action of multiple pathophysiological processes. The power of mathematical analysis and computational modeling is increasingly utilized in basic and clinical epilepsy research to better understand the relative importance of the multifaceted seizure-related changes taking place in the brain during an epileptic seizure. This groundbreaking book is designed to synthesize the current ideas and future directions of the emerging discipline of computational epilepsy research. Chapters address relevant basic questions e.g. neuronal gain control as well as long-standing critically important clinical challenges e.g. seizure prediction. Computational Neuroscience in Epilepsy should be of high interest to a wide range of readers including undergraduate and graduate students, postdoctoral fellows, and faculty working in the fields of basic or clinical neuroscience, epilepsy research, computational modeling, and bioengineering. Covers a wide range of topics from molecular to seizure predictions and brain implants to control seizures. Contributors are top experts at the forefront of computational epilepsy research. Chapter contents are highly relevant to both basic and clinical epilepsy researchers.

Epilepsy Susan Arthurs, 2017-03-29 Epilepsy, one of the most prevalent neurological disorders, affects approximately 1% greater than 60 million of the world's population. In an estimated 20 million of these patients, seizures are not controlled even by multiple anti-seizure drugs and are extremely difficult to predict. Epilepsy: The Intersection of Neurosciences, Biology, Mathematics, Engineering, and Physics seamlessly brings together the neurosciences, mathematics, computational sciences, engineering, physics, and clinical epileptology to present to readers a highly didactic, integrated, clear, and practically useful knowledge base and research directions. Laying out the foundations of signal analysis, data conditioning, linear and non-linear analysis, introduction to dynamical systems, and fundamental anatomical and neurophysiological concepts, this book introduces non-physicians to language and concepts necessary to establish a meaningful dialog with epileptologists. Introduces physicians to dynamical theory and signal processing without which interdisciplinary collaborations would not be productive. Mines knowledge from fields devoted to the investigation of aperiodic, paroxysmal relaxation phenomena such as earthquakes, which bear dynamical similarities with epilepsy, so as to lay the proper scientific foundations for epileptology and foster much-needed therapeutic advances efficiently. Reviews spatiotemporal behavior of seizures, mechanisms of epileptogenesis and ictogenesis, as well as of seizure control and ancillary technology. Calls attention to nocturnal frontal lobe epilepsy as a potentially fruitful paradigm for advancing seizure prediction. Of all neurological disorders, epilepsy demands of investigators the broadest and deepest knowledge of dynamical control and system theories, knowledge that cannot be amassed without possessing a certain level of sophistication in relevant areas of neurosciences, physics, mathematics, and engineering. Narrowing the inescapable cultural chasm that commonly fragments multidisciplinary efforts, this book captures and enriches the burgeoning interdisciplinary synergism in

the nascent field of dynamical epileptology
