Willich, S. Elm, 2013-04-17 In 1978 the World Health Organization WHO designated the year 2000 as the due date for world health The Alma Ata declaration set the turn of the century as the target for a level of health that would permit all people of the world to lead a socially and economically productive life At that magic but arbitrary date most

infectious diseases and many chronic conditions including diabetes and cancer were expected to have been eradicated or at least controlled. Such predictions were based on solid foundations. In the 20th century and particularly since the 1970s, Western science and technology based on modern medicine has made quantum leaps in numerous areas as diverse as pharmacology, genetic and molecular biology, surgical techniques, infertility treatments, and pre and neonatal care. This impressive trajectory of progress which continues unabatedly gave every reason to assume that come the year 2000, humanity would finally be free from many of its ancient scourges. However, as we are all too well aware, the new millennium witnesses also ever more terrifying threats to our health as a result of the emergence of AIDS in the early 80s, the resurgence of infectious diseases such as tuberculosis and malaria now drug resistant, the absence of significant breakthroughs in the treatment of cancer and cardiovascular diseases, and the continuing dramatic gap in health care between industrialized and developing countries to mention but a few examples.

HVAC Control in the New Millennium

Michael F. Hordeski, 2001-01-31. Advances in personal computer control and sensor technology are leading the advances in building controls as we enter the new millennium. Pushing the technology are potentially high reductions in operating costs from increased operational efficiency. Building conditioning now accounts for about 20% of the total energy consumed in the U.S., so computer optimized HVAC systems can make a major contribution in reducing our national energy use. This book examines how the latest advances in distributed technology will be used in commercial systems. Topics include the full scope of current and emerging HVAC control technologies covering personal computer based systems, expert systems, fiber optic, infrared technologies, wireless communication, self optimizing software, sensors, micro technology, distributed direct digital control, control bus techniques, and more.

[Handbook of Research on Software Quality Innovation in Interactive Systems](#)

Cipolla-Ficarra, Francisco Vicente, 2021-03-19. The inclusion of experts in communicability in the software industry has allowed timeframes to speed up in the commercialization of new technological products worldwide. However, this constant evolution of software in the face of the hardware revolution opens up a host of new horizons to maintain and increase the quality of the interactive systems following a set of standardized norms and rules for the production of interactive software. Currently, we see some efforts towards this goal, but they are still partial solutions, incomplete and flawed from the theoretical as well as practical points of view. If the quality of the interactive design is analyzed, it is left to professionals to generate systems that are efficient, reliable, user friendly, and cutting edge. The Handbook of Research on Software Quality Innovation in Interactive Systems analyzes the quality of the software applied to the interactive systems and considers the constant advances in the software industry. This book reviews the past and present of information and communication technologies with a projection towards the future, along with analyses of software design phrases to use and the purposes for software applications in interactive systems. This book is ideal for students, professors, researchers, programmers, analysts of systems, computer engineers, interactive designers, managers of software quality, and evaluators of interactive systems.
