

Chapter 11: Cell Communication

- 11.1 Describe how external signals are converted to responses within cells.
- 11.2 Identify different types of signal receptors and explain how they function.
- 11.3 Explain the roles of phosphorylation, dephosphorylation, and second messengers in signal transduction.
- 11.4 Describe how cells respond to signaling, including fine-tuning of the response.
- 11.5 Use apoptosis as an example to illustrate how multiple signaling pathways can be integrated in a cell.

The special challenge in Chapter 11 is not that the material is difficult to understand but that most of the material may be completely new to you. Cell communication is often not covered in introductory high school biology courses, yet perhaps no other section of biology has grown as much as our understanding of cell signaling in the last decade. Take your time with this section, and you will be rewarded with a knowledge base that will be most helpful in this course and courses to come.

Study Tip: Figure 11.1 in your text explains the desperate flight of an impala at the cellular level. It shows how the signal (sensing a cheetah nearby) leads to the release of more glucose to power an escape. Although the specific details are unique to the signal, cell signals show three definite stages. Label and describe the three stages for this example in the boxes below. These three stages of the cell signal response are consistent across all types of cell signals.

Concept 11.1 External signals are converted to responses within the cell

LO 11.1: Describe how external signals are converted to responses within cells.

1. Cell signaling in bacteria provides evidence this is an ancient process that first evolved hundreds of millions of years ago. What is *quorum sensing*, a signaling mechanism seen in bacteria today? How is it related to *biofilms*?

Quorum sensing is a phenomenon in which bacterial cells sense the concentration of signaling molecules from other bacteria to monitor their own local cell density. It allows bacterial populations to coordinate the behavior of all cells in a population in activities that require a given density of cell acting at the same time.

Taylor, 1999 Macrophages in inflammation and its resolution Heiko Mühl, Patrizia Rovere-Querini, Amiram Ariel, Jerrold S. Levine, Isabelle Maridonneau-Parini, Macrophages were initially identified as a key element in the innate host response to infection and injury due to their phagocytic clearance and elimination of pathogenic and non pathogenic entities However as macrophage research advanced it became clear that not only are these cells amenable to the acquisition of multiple plastic phenotypes during inflammatory responses to different pathogens they also play a paramount role in the termination of inflammation and acquired immune responses In addition macrophages profoundly affect host physiology when they migrate to distant sites and differentiate to specialized cells like foam cells osteoclasts adipose tissue and tumor associated macrophages and other macrophage derived cell types These processes are affected by the inflammation resolution axis and can result in health threats such as atherosclerosis bone loss obesity fibrosis and cancer This Research Topic issue will cover a wide range of topics in macrophage biology 1 Macrophages in immune responses to pathogens 2 Macrophages in the termination of acute and acquired immunity 3 The role of macrophages and their descendents in inflammation associated pathologies 4 Macrophage polarization and differentiation Particular focus will be given to the modulation of macrophage phenotype and function following their encounter with apoptotic cells and the signaling cascades that govern these changes Campbell Biology Australian and New Zealand Edition Jane B.
