Combustion Combustion:

Combustion 2e Irvin Glassman, 2012-12-02 Combustion Second Edition focuses on the underlying principles of combustion and covers topics ranging from chemical thermodynamics and flame temperatures to chemical kinetics detonation ignition and oxidation characteristics of fuels Diffusion flames flame phenomena in premixed combustible gases and combustion of nonvolatile fuels are also discussed This book consists of nine chapters and begins by introducing the reader to heats of reaction and formation free energy and the equilibrium constants and flame temperature calculations The next chapter explores the rates of reactions and their temperature dependency simultaneous interdependent and chain reactions pseudo first order reactions the partial equilibrium assumption and pressure effect in fractional conversion The chain branching reactions and criteria for explosion explosion are then considered along with the limits and oxidation characteristics of fuels such as hydrogen carbon monoxide and hydrocarbons The remaining chapters look at the laminar flame speed and stability limits of laminar flames deflagration and detonation burning in convective atmospheres and the theory of thermal ignition The final chapter is devoted to the burning of nonvolatile fuels such as coal This monograph will be a valuable resource for students and teachers of physics

Combustion Jerzy Chomiak, 1990-01 This book aims to provide a broad view of combustion science written for readers who may be specialists in one of the combustion related areas but who require a knowledge of the subject as a whole The work is in three parts Parts 1 and 2 contain an account of combustion theory with emphasis on turbulent flame phenomena coal combustion and fire problems Part 3 concerns combustion design research fundamentals and combustion technology NASA Thesaurus ,1994

Combustion Jürgen Warnatz, Ulrich Maas, Robert W. Dibble, 2012-12-06

Combustion is an old technology which at present provides about 90% of our worldwide energy support. Combustion research in the past used fluid mechanics with global heat release by chemical reactions described with thermodynamics assuming infinitely fast reactions. This approach was useful for stationary combustion processes but it is not sufficient for transient processes like ignition and quenching or for pollutant formation. Yet pollutant formation during combustion of fossil fuels is a central topic and will continue to be so in future. This book provides a detailed and rigorous treatment of the coupling of chemical reactions and fluid flow. Also combustion specific topics of chemistry and fluid mechanics are considered and tools described for the simulation of combustion processes.
