Combinatorics and Random Matrix Theory Jinho Baik, Percy Deift, Toufic Suidan, 2016-06-22 Over the last fifteen years a variety of problems in combinatorics have been solved in terms of random matrix theory More precisely the situation is as follows the problems at hand are probabilistic in nature and in an appropriate scaling limit it turns out that certain key quantities associated with these problems behave statistically like the eigenvalues of a large random matrix Said differently random matrix theory provides a stochastic special function theory for a broad and growing class of problems in combinatorics The goal of this book is to analyze in detail two key examples of this phenomenon viz Ulam's problem for increasing subsequences of random permutations and domino tilings of the Aztec diamond Other examples are also described along the way but in less detail Techniques from many different areas in mathematics are needed to analyze these problems These areas include combinatorics probability theory functional analysis complex analysis and the theory of integrable systems The book is self contained and along the way we develop enough of the theory we need from each area that a general reader with say two or three years experience in graduate school can learn the subject directly from the text
