Cognition And Cancer:

Cognition and Cancer Christina A. Meyers, James R. Perry, 2008-10-30 The majority of cancer patients on active treatment experience cognitive impairments often referred to as chemobrain or chemofog. In addition, patients with primary or metastatic tumors of the brain experience direct neurologic symptoms due, for example, to the location of their disease, surgical intervention, and the late effects of treatment such as radiotherapy. The aim of this book is to serve as a resource for health care professionals working with cancer patients who experience cognitive changes as a result of their cancer and its treatment. It provides practical information to help *The Effects of Chemotherapy on Cognition in Women with Breast Cancer* Erin O'Farrell, 2017 Advances in cancer treatment have led to increasing numbers of survivors left to struggle with the long-term adverse effects of disease and treatment. Many possible effects have been described, including anxiety, depression, as well as physical side effects and consequences of cancer treatment. One particular adverse effect that is frequently reported but often overlooked in clinical practice is disturbances of cognitive functioning. Cancer-related cognitive impairment (CRCI) is a growing area of research with important clinical implications for current patients and survivors. Despite a huge increase in this research endeavour in the last 20 years, many important questions remain unanswered due, in large part, to methodological limitations of many of the studies. The overall goal of this dissertation is to critically examine previous CRCI research from a methodological perspective. It will explore limitations and confounds in this research and provide suggestions for improving future work. This dissertation is comprised of three manuscripts: a critical literature review and two original papers addressing specific research questions. The first original paper addresses the disparity between the results of objective performance-based and subjective self-report measures of cognition that is typically observed in samples of cancer patients, using multilevel modeling to explore the hypothesis that this is due to failure to address measures of change over time. Despite negative findings, the methodological approach taken to this research question provided greater evidence for this subjective-objective disparity, as well as methodological suggestions for future studies. The second original paper explores the sensitivity and validity of a computerized cognitive test for measuring CRCI to determine if it might be an appropriate alternative to traditional resource-intensive neuropsychological testing. This study found that although the computerized measure of cognitive functioning was not sensitive enough to detect changes at the individual level or within specific domains, it was sensitive to changes in cognitive functioning at the group level, suggesting its usefulness as a screening tool in research settings. By addressing methodological limitations of research to date and specifically the two issues identified above, this dissertation aims to: a) make recommendations to help improve the quality of future research, b) validate the cognitive complaints of cancer patients, and c) improve access to cognitive assessments, leading to increased detection and treatment of cognitive side effects and improvement in quality of life of cancer survivors. **Clinical Psycho-Oncology** Luigi Grassi, Michelle Riba, 2012-05-18 This international primer on psycho-oncology spans settings of care as well as regional

Handbook on the Neuropsychology of Aging and Dementia Lisa D. Ravdin, Heather L. Katzen, 2012-09-14 With the aging of the baby boomers and medical advances that promote longevity older adults are rapidly becoming the fastest growing segment of the population As the population ages so does the incidence of age related disorders Many predict that 15% 20% of the baby boomer generation will develop some form of cognitive decline over the course of their lifetime with estimates escalating to up to 50% in those achieving advanced age Although much attention has been directed at Alzheimer s disease the most common form of dementia it is estimated that nearly one third of those cases of cognitive decline result from other neuropathological mechanisms In fact many patients diagnosed with Alzheimer s disease likely have co morbid disorders that can also influence cognition i e vascular cognitive impairment suggesting mixed dementias are grossly under diagnosed The Clinical Handbook on the Neuropsychology of Aging and Dementia is a unique work that provides clinicians with expert guidance and a hands on approach to neuropsychological practice with older adults The book will be divided into two sections the first addressing special considerations for the evaluation of older adults and the second half focusing on common referral questions likely to be encountered when working with this age group The authors of the chapters are experts and are recognized by their peers as opinion leaders in their chosen chapter topics The field of neuropsychology has played a critical role in developing methods for early identification of late life cognitive disorders as well as the differential diagnosis of dementia Neuropsychological assessment provides valuable clinical information regarding the nature and severity of cognitive

symptoms associated with dementia Each chapter will reinforce the notion that neuropsychological measures provide the clinician with sensitive tools to differentiate normal age related cognitive decline from disease associated impairment aid in differential diagnosis of cognitive dysfunction in older adults as well as identify cognitive deficits most likely to translate into functional impairments in everyday life **Cognitive Rehabilitation and Neuroimaging** John DeLuca, Nancy D.
