Freshwater Prawn Culture Michael Bernard

New, Wagner Cotroni Valenti, 2008-04-15 The farming of the freshwater prawn *Macrobrachium rosenbergii* has developed rapidly during recent years. Advances in techniques and the huge expansion of world demand for this species continue to stimulate the growth of a multi million dollar industry. This landmark publication is a compendium of information on every aspect of the farming of *M. rosenbergii*. A comprehensive review of the status of freshwater prawn farming research, development and commercial practice, the book is intended to stimulate further advances in the knowledge and understanding of this important field. An extremely well known and internationally respected team of contributing authors have written cutting edge chapters covering all major aspects of the subject. Coverage includes biology, hatchery and grow out culture systems, feeds and feeding, up to date information on the status of freshwater prawn farming around the world, post harvest handling and processing, markets and economics and business management. Further chapters are devoted to the culture of other prawn species, prawn capture fisheries and the sustainability of freshwater prawn culture. Contributions to the book have been brought together and edited by Michael New and Wagner Valenti themselves widely known for their work in this area. The comprehensive information in *Freshwater Prawn Culture* will give an important commercial edge to anyone involved in the culture and trade of freshwater prawns. Readership should include prawn farm personnel, business managers and researchers and invertebrate freshwater and crustacean biologists. Copies of the book should be available on the shelves of all libraries in research establishments and universities where aquaculture and fisheries are studied and taught. Michael Bernard New OBE is a Past President of the World Aquaculture Society and President Elect of the European Aquaculture Society. Wagner Cotroni Valenti is a Professor at the Aquaculture Center, S o Paulo State University, Brazil.

Advances in Harvest and Post-Harvest Technology of Fishes D.D. Nambudiri, 2012-01-15 In recent years there have been notable advances in the fisheries. Progresses made in refinements of vessels, new line materials and line handling systems, preserving the catch, the availability of oceanographic sensor equipments and the utilization of satellite technology to locate potential fishing grounds have greatly improved the fishing power of longline vessels. Post harvest technology of fish has evolved in the last one decade to a more energy efficient, cost effective and quality upgrading technology. Since fresh fish can get spoiled very quickly, the development of technology for post harvest preservation and methodology to convert fish to value added products have also become popular in recent times. Value addition helps in getting high price for the fishery products. There is a need to develop competent human resources in the field of post harvest management of fish and production of value added products from them. It is required to inculcate vocational and entrepreneurial skills in order to widen employment opportunities particularly among rural youth and the disadvantaged sections of the society as well as to enable self employment. Handbook on Ingredients for Aquaculture Feeds J.W. Hertrampf, F. Piedad-Pascual, 2012-12-06 Current growth in global aquaculture is paralleled by an equally significant increase in companies involved in aquafeed manufacture. Latest information has identified over 1 200 such companies not including those organizations in production of

a variety of other materials i.e. vitamins, minerals and therapeutics all used in varying degrees in proper feed formulation. Aquaculture industries raising particular economically valued species i.e. penaeid shrimps and salmonids are making major demands on feed ingredients while relatively new industries such as tilapia farming portend a significant acceleration in demand for properly formulated aquafeeds by the end of the present decade and into the next century. As requirements for aquafeeds increase, shortages are anticipated in various ingredients especially widely used proteinaceous resources such as fish meal. A variety of other proteinaceous commodities are being considered as partial or complete replacement for fish meal especially use of plant protein sources such as soybean meal. In the past five years vegetable protein meal production has increased 10% while fish meal production has dropped over 50% since 1989 largely attributed to overfishing and serious decline in wild stock. Throughout fisheries processing industries traditional concepts as waste have given way to more prudent approaches emphasizing total by-product recovery. Feed costs are a major consideration in aquaculture where in some groups i.e. salmonids high protein containing feeds using quality fish meal can account for as much as 40 to 60% of production costs.
