Data Analysis Devinderjit Sivia, John Skilling, 2006-06 Focusing on Bayesian methods and maximum entropy this book shows how a few fundamental rules can be used to tackle a variety of problems in data analysis Topics covered include reliability analysis multivariate optimisation least squares and maximum likelihood and more

Data Analysis Josh Correll, Abigail M. Folberg, Charles M. Judd, Gary H. McClelland, Carey S. Ryan, 2025-08-04 This essential textbook provides an integrated treatment of data analysis for the social and behavioral sciences It covers all the key statistical models in an integrated manner that relies on the comparison of models of data estimated under the rubric of the general linear model The text describes the foundational logic of the unified model comparison framework It then shows how this framework can be applied to increasingly complex models including multiple continuous and categorical predictors as well as product predictors i e interactions and nonlinear effects The text also describes analyses of data that violate assumptions of independence homogeneity and normality The analysis of nonindependent data is treated in some detail covering standard repeated measures analysis of variance and providing an integrated introduction to multilevel or hierarchical linear models and logistic regression Highlights of the fourth edition include Expanded coverage of generalized linear models and logistic regression in particular A discussion of power and ethical statistical practice as it relates to the replication crisis An expanded collection of online resources such as PowerPoint slides and test bank for instructors additional exercises and problem sets with answers new data sets practice questions and R code Clear and accessible this text is intended for advanced undergraduate and graduate level courses in data analysis Access the Instructor Resources for this title at routledge-textbooks.com/textbooks/instructor_downloads

Sivia, 1996 This is the first book on the maximum entropy and Bayesian methods aimed at senior undergraduates in science and engineering It takes the mystery out of statistics by showing how a few fundamental rules can be used to tackle a wide variety of problems in data analysis After explaining the basic principles of Bayesian probability theory their use is illustrated with a variety of examples ranging from elementary parameter estimation to image processing Other topics covered include reliability analysis multivariate optimization least squares and maximum likelihood error propagation hypothesis testing maximum entropy and experimental design As a logical and unified approach to the subject of data analysis with a self contained tutorial approach this work will be valued by instructors and students alike

Doing Bayesian Data Analysis John Kruschke, 2014-11-11 Doing Bayesian Data Analysis A Tutorial with R JAGS and Stan Second Edition provides an accessible approach for conducting Bayesian data analysis as material is explained clearly with concrete examples Included are step by step instructions on how to carry out Bayesian data analyses in the popular and free software R and WinBugs as well as new programs in JAGS and Stan The new programs are designed to be much easier to use than the scripts in the first edition In particular there are now compact high level scripts that make it easy to run the programs on your own data sets The book is

divided into three parts and begins with the basics models probability Bayes rule and the R programming language The discussion then moves to the fundamentals applied to inferring a binomial probability before concluding with chapters on the generalized linear model Topics include metric predicted variable on one or two groups metric predicted variable with one metric predictor metric predicted variable with multiple metric predictors metric predicted variable with one nominal predictor and metric predicted variable with multiple nominal predictors The exercises found in the text have explicit purposes and guidelines for accomplishment This book is intended for first year graduate students or advanced undergraduates in statistics data analysis psychology cognitive science social sciences clinical sciences and consumer sciences in business Accessible including the basics of essential concepts of probability and random sampling Examples with R programming language and JAGS software Comprehensive coverage of all scenarios addressed by non Bayesian textbooks t tests analysis of variance ANOVA and comparisons in ANOVA multiple regression and chi square contingency table analysis Coverage of experiment planning R and JAGS computer programming code on website Exercises have explicit purposes and guidelines for accomplishment Provides step by step instructions on how to conduct Bayesian data analyses in the popular and free software R and WinBugs
