Algorithm Engineering Matthias Müller-Hannemann, Stefan Schirra, 2010-08-05 Algorithms are essential building blocks of computer applications. However, advancements in computer hardware which render traditional computer models more and more unrealistic and an ever increasing demand for efficient solutions to actual real world problems have led to a rising gap between classical algorithm theory and algorithmics in practice. The emerging discipline of Algorithm Engineering aims at bridging this gap. Driven by concrete applications, Algorithm Engineering complements theory by the benefits of experimentation and puts equal emphasis on all aspects arising during a cyclic solution process ranging from realistic modeling, design, analysis, robust and efficient implementations to careful experiments. This tutorial outcome of a GI Dagstuhl Seminar held in Dagstuhl Castle in September 2006 covers the essential aspects of this process in ten chapters on basic ideas, modeling and design issues, analysis of algorithms, realistic computer models, implementation aspects and algorithmic software libraries, selected case studies as well as challenges in Algorithm Engineering. Both researchers and practitioners in the field will find it useful as a state of the art survey.

Workstations and Publication Systems Rae Earnshaw, 2012-12-06 Review Office automation and associated hardware and software technologies are producing significant changes in traditional typing, printing and publishing techniques and strategies. The long term impact of current developments is likely to be even more far reaching as reducing hardware costs, improved human computer interfacing, uniformity through standardization and sophisticated software facilities will all combine together to provide systems of power, capability and flexibility. The configuration of the system can be matched to the requirements of the user, whether typist, clerk, secretary, scientist, manager, director or publisher. Enormous advances are currently being made in the areas of publication systems in the bringing together of text and pictures and the aggregation of a greater variety of multi media documents. Advances in technology and reductions in cost and size have produced many desk top publishing systems in the market place. More sophisticated systems are targeted at the high end of the market for newspaper production and quality color output. Outstanding issues in desk top publishing systems include interactive editing of structured documents, integration of text and graphics, page description languages, standards and the human computer interface to documentation systems. The latter area is becoming increasingly important, usability by non specialists and flexibility across application areas are two current concerns. One of the objectives of current work is to bring the production of high quality documents within the capability of naive users as well as experts.
