Part-A

I. Prepare hardware and software specification for basic computer system and networking

The following are the three methods of connecting a computer to the Internet using software and hardware peripherals.

- ❖ Establishing an internet connection via Wireless Broadband
- ❖ Linking a computer to the internet through an Ethernet Cable
- ❖ Connecting a Computer to the internet via a Dial-Up Connection

Hardware requirements:

Modem (Modulator and Demodulator)

- Modem is a device which converts computer data to a signal that can be transmitted over the network.

NIC (Network Interface Card)

- A network interface card (NIC) is a hardware component without which a computer cannot be connected over a network. It is a circuit board installed in a computer that provides a dedicated network connection to the computer. It is also called network interface controller, network adapter, or LAN adapter.
- NIC allows both wired and wireless communications.
- NIC allows communications between computers connected via local area network (LAN) as well as communications over large-scale network through Internet Protocol (IP).
- NIC is both a physical layer and a data link layer device, i.e. it provides the necessary hardware circuitry so that the physical layer processes and some data link layer processes can run on it.

Repeater

- A repeater operates at the physical layer.
- It is a 2 port device. One for input and one for output.
- Its job is to regenerate the signal before the signal becomes too weak.
- Repeater is not amplifier, repeater copy the signal bit by bit and regenerate it at the original strength.
- Repeater is a low cost device.
