CHAPTER OVERVIEW

This chapter introduces students to characteristics of organizations and to the perspective that organizations are systems of interrelated units that have to adapt to their environment to survive. Definitions and examples are given to provide students with an understanding of the importance of organizational theory in becoming better managers and leaders in a rapidly changing world. The Hudson's Bay Company (HBC) case that opens the chapter is an interesting case to refer to during the semester and to update using current business analyses.

Organizational theory is discussed in historical stages and is shown to have practical application for managers. A framework for the content and topic of each chapter is also provided. Instructors can use this as an introductory overview and also as a frame of

Embedded SoPC Design with Nios II Processor and Verilog Examples Pong P. Chu, 2012-05-14 Explores the unique hardware programmability of FPGA based embedded systems using a learn by doing approach to introduce the concepts and techniques for embedded SoPC design with Verilog. An SoPC system on a programmable chip integrates a processor, memory modules, I/O peripherals, and custom hardware accelerators into a single FPGA field programmable gate array device. In addition to the customized software, customized hardware can be developed and incorporated into the embedded system as well, allowing us to configure the soft-core processor, create tailored I/O interfaces, and develop specialized hardware accelerators for computation-intensive tasks. Utilizing an Altera FPGA prototyping board and its Nios II soft-core processor, *Embedded SoPC Design with Nios II Processor and Verilog Examples* takes a learn by doing approach to illustrate the hardware and software design and development process by including realistic projects that can be implemented and tested on the board. Emphasizing hardware design and integration throughout, the book is divided into four major parts. Part I covers HDL and synthesis of custom hardware. Part II introduces the Nios II processor and provides an overview of embedded software development. Part III demonstrates the design and development of hardware and software for several complex I/O peripherals, including a PS2 keyboard and mouse, a graphic video controller, an audio codec, and an SD secure digital card. Part IV provides several case studies of the integration of hardware accelerators, including a custom GCD (greatest common divisor) circuit, a Mandelbrot set fractal circuit, and an audio synthesizer based on DDFS (direct digital frequency synthesis) methodology. While designing and developing an embedded SoPC can be rewarding, the learning can be a long and winding journey. This book shows the trail ahead and guides readers through the initial steps to exploit the full potential of this emerging methodology.

Embedded SoPC Design with Nios II Processor and VHDL Examples Pong P. Chu, 2011-08-29 The book is divided into four major parts. Part I covers HDL constructs and synthesis of basic digital circuits. Part II provides an overview of embedded software development with the emphasis on low-level I/O access and drivers. Part III demonstrates the design and development of hardware and software for several complex I/O peripherals, including PS2 keyboard and mouse, a graphic video controller, an audio codec, and an SD secure digital card. Part IV provides three case studies of the integration of hardware accelerators, including a custom GCD (greatest common divisor) circuit, a Mandelbrot set fractal circuit, and an audio synthesizer based on DDFS (direct digital frequency synthesis) methodology. The book utilizes FPGA devices, Nios II soft-core processor, and development platform from Altera Co., which is one of the two main FPGA manufacturers. Altera has a generous university program that provides free software and discounted prototyping boards for educational institutions. Details at www.altera.com/university. The two main educational prototyping boards are known as DE1-99 and DE2-69. All experiments can be implemented and tested with these boards. A board combined with this book becomes a turn-key solution for the SoPC design experiments and projects. Most HDL and C codes in the book are device-independent and can be adapted

by other prototyping boards as long as a board has similar I O configuration

Parallel Programming Thomas Rauber, Gudula Rünger, 2023-04-04 This textbook covers the new development in processor architecture and parallel hardware It provides detailed descriptions of parallel programming techniques that are necessary for developing efficient programs for multicore processors as well as for parallel cluster systems and supercomputers The book is structured in three main parts covering all areas of parallel computing the architecture of parallel systems parallel programming models and environments and the implementation of efficient application algorithms The emphasis lies on parallel programming techniques needed for different architectures In particular this third edition includes an extended update of the chapter on computer architecture and performance analysis taking new developments such as the aspect of energy consumption into consideration The description of OpenMP has been extended and now also captures the task concept of OpenMP The chapter on message passing programming has been extended and updated to include new features of MPI such as extended reduction operations and non blocking collective communication operations The chapter on GPU programming also has been updated All other chapters also have been revised carefully The main goal of this book is to present parallel programming techniques that can be used in many situations for many application areas and to enable the reader to develop correct and efficient parallel programs Many example programs and exercises are provided to support this goal and to show how the techniques can be applied to further applications The book can be used as a textbook for students as well as a reference book for professionals The material of the book has been used for courses in parallel programming at different universities for many years
