Parallel Programming Thomas Rauber, Gudula Rünger, 2010-03-16 Innovations in hardware architecture like hyper threading or multicore processors mean that parallel computing resources are available for inexpensive desktop computers. In only a few years many standard software products will be based on concepts of parallel programming implemented on such hardware and the range of applications will be much broader than that of scientific computing up to now. The main application area for parallel computing. Rauber and Rünger take up these recent developments in processor architecture by giving detailed descriptions of parallel programming techniques that are necessary for developing efficient programs for multicore processors as well as for parallel cluster systems and supercomputers. Their book is structured in three main parts covering all areas of parallel computing: the architecture of parallel systems, parallel programming models and environments, and the implementation of efficient application algorithms. The emphasis lies on parallel programming techniques needed for different architectures. The main goal of the book is to present parallel programming techniques that can be used in many situations for many application areas and which enable the reader to develop correct and efficient parallel programs. Many examples and exercises are provided to show how to apply the techniques. The book can be used as both a textbook for students and a reference book for professionals. The presented material has been used for courses in parallel programming at different universities for many years. *Resources in Education*, 1998

Handbook of Data Structures and Applications Dinesh P. Mehta, Sartaj Sahni, 2018-02-21 The Handbook of Data Structures and Applications was first published over a decade ago. This second edition aims to update the first by focusing on areas of research in data structures that have seen significant progress. While the discipline of data structures has not matured as rapidly as other areas of computer science, the book aims to update those areas that have seen advances. Retaining the seven part structure of the first edition, the handbook begins with a review of introductory material followed by a discussion of well known classes of data structures: Priority Queues, Dictionary Structures, and Multidimensional structures. The editors next analyze miscellaneous data structures which are well known structures that elude easy classification. The book then addresses mechanisms and tools that were developed to facilitate the use of data structures in real programs. It concludes with an examination of the applications of data structures. Four new chapters have been added on Bloom Filters, Binary Decision Diagrams, Data Structures for Cheminformatics, and Data Structures for Big Data Stores, and updates have been made to other chapters that appeared in the first edition. The Handbook is invaluable for suggesting new ideas for research in data structures and for revealing application contexts in which they can be deployed. Practitioners devising algorithms will gain insight into organizing data allowing them to solve algorithmic problems more efficiently. **Data Processing Digest**, 1984

Object Recognition M. Bennamoun, G.J. Mamic, 2012-12-06 Automatic object recognition is a multidisciplinary research area using concepts and tools from mathematics, computing, optics, psychology, pattern recognition, artificial intelligence, and various

other disciplines The purpose of this research is to provide a set of coherent paradigms and algorithms for the purpose of designing systems that will ultimately emulate the functions performed by the Human Visual System HVS Hence such systems should have the ability to recognise objects in two or three dimensions independently of their positions orientations or scales in the image The HVS is employed for tens of thousands of recognition events each day ranging from navigation through the recognition of landmarks or signs right through to communication through the recognition of characters or people themselves Hence the motivations behind the construction of recognition systems which have the ability to function in the real world is unquestionable and would serve industrial e g quality control military e g automatic target recognition and community needs e g aiding the visually impaired Scope Content and Organisation of this Book This book provides a comprehensive yet readable foundation to the field of object recognition from which research may be initiated or guided It represents the culmination of research topics that I have either covered personally or in conjunction with my PhD students These areas include image acquisition 3 D object reconstruction object modelling and the matching of objects all of which are essential in the construction of an object recognition system *Chemical Engineering* Dilip K.
