Plant Life Cycle

The plant life cycle is a fascinating process that shows how plants grow, reproduce, and continue their species. All plants follow a similar cycle, starting from a seed and going through several stages until they create new seeds.

The first stage is the **seed**. Seeds contain the tiny beginning of a plant, called an embryo, along with food stored for growth. Seeds come in many shapes and sizes, and they need the right conditions: water, air, and the right temperature to begin growing.

When conditions are right, a seed begins to grow through a process called **germination**. The seed absorbs water and swells. The outer shell softens, and a tiny root (called a radicle) starts to push downward into the soil, while a small shoot reaches upward.

Next, the plant enters the **seedling** stage. During this time, the young plant grows leaves and begins to make its own food through **photosynthesis**. This process uses sunlight, water, and carbon dioxide to make energy. The seedling continues to grow stronger and taller.

As the plant matures, it enters the **adult plant** stage. It develops more leaves, stems, and roots. If it's a flowering plant, it begins to grow **seeds**. These seeds will eventually open into flowers, which are important for reproduction.

Pollination happens when pollen from one flower is transferred to another, often with the help of insects, wind, or water. The pollen enters the female part of the flower that contains the eggs, and **fertilization** begins. This leads to the formation of seeds.

After pollination and fertilization, the flower's body develops into a **fruit**. The seeds grow inside the fruit. When the fruit ripens, it may fall to the ground, be eaten by animals, or be carried away by the wind or water.

The cycle begins again when these seeds find the right conditions to grow. The plant life cycle ensures that plants keep growing, feeding animals and humans, and producing oxygen for the Earth.
