Vinogradov,Alessandro De Paris,2008-12-11 The theory of connections is central not only in pure mathematics differential and algebraic geometry but also in mathematical and theoretical physics general relativity gauge fields mechanics of continuum media The now standard approach to this subject was proposed by Ch Ehresmann 60 years ago attracting first mathematicians and later physicists by its transparent geometrical simplicity Unfortunately it does not extend well to a number of recently emerged situations of significant importance singularities supermanifolds infinite jets and secondary calculus etc Moreover it does not help in understanding the structure of calculus naturally related with a connection In this unique book written in a reasonably self contained manner the theory of linear connections is systematically presented as a natural part of differential calculus over commutative algebras This not only makes easy and natural numerous generalizations of the classical theory and reveals various new aspects of it but also shows in a clear and transparent manner the intrinsic structure of the associated differential calculus The notion of a fat manifold introduced here then allows the reader to build a well working analogy of this connection calculus with the usual one **Interconnected World, Lost**
