Control Systems and Mathematical Methods in Economics Gustav Feichtinger, Raimund M. Kovacevic, Gernot Tragler, 2018-06-08 Since the days of Lev Pontryagin and his associates the discipline of Optimal Control has enjoyed a tremendous upswing not only in terms of its mathematical foundations but also with regard to numerous fields of application which have given rise to highly active research areas Few scholars however have been able to make contributions to both the mathematical developments and the socio economic applications Vladimir Veliov is one of them In the course of his scientific career he has contributed highly influential research on mathematical aspects of Optimal Control Theory as well as applications in Economics and Operations Research One of the hallmarks of his research is its impressive breadth This volume published on the occasion of his 65th birthday accurately reflects that diversity The mathematical aspects covered include stability theory for difference inclusions metric regularity generalized duality theory the Bolza problem from a functional analytic perspective and fractional calculus In turn the book explores various applications of control theory such as population dynamics population economics epidemiology optimal growth theory resource and energy economics environmental management and climate change Further topics include optimal liquidity dynamics of the firm and wealth inequality

Comparison Methods in Control George Bitsoris, 2025-10-08 This book presents the theoretical foundations of the comparison approach and demonstrates how this

method can be used for the development of techniques for the analysis and design of control systems in the state space domain. It provides a framework for using the comparison approach to solve fundamental analysis and design problems of control systems including invariance and contractivity stability analysis and constrained control. Within this framework, the book shows the reader that the invariance of sets represented by sublevel subsets, the control invariant regions, the stability properties, and the design of constrained controllers for both continuous time and discrete time systems can be investigated using comparison systems. The dual approach of analysis and design based on the representation of state space regions in terms of a number of generators and a generating function is developed. Polyhedral invariant sets, polyhedral control invariance, stability analysis using polyhedral Lyapunov functions, and constrained control under linear constraints are also investigated. *Comparison Methods in Control* begins with an introduction and discusses stability, Lyapunov theory, and representation of connected sets. The book progresses through comparison in different contexts such as comparison and invariance, comparison and stability, dual comparison systems, and control invariance. Constrained regulation problems and constrained control of disturbed and parameter uncertain systems are all given equal attention. Researchers and postgraduate students with backgrounds in systems analysis, control, and applied mathematics will find this monograph of interest.

System Identification (SYSID '03) Paul Van Den Hof, Bo Wahlberg, Siep Weiland, 2004-06-29. The scope of the symposium covers all major aspects of system identification: experimental modelling, signal processing, and adaptive control, ranging from theoretical, methodological, and scientific developments to a large variety of engineering application areas. It is the intention of the organizers to promote SYSID 2003 as a meeting place where scientists and engineers from several research communities can meet to discuss issues related to these areas. Relevant topics for the symposium program include: Identification of linear and multivariable systems; identification of nonlinear systems including neural networks; identification of hybrid and distributed systems; Identification for control; experimental modelling in process control; vibration and modal analysis; model validation; monitoring and fault detection; signal processing and communication; parameter estimation and inverse modelling; statistical analysis and uncertainty bounding; adaptive control and data based controller tuning; learning; data mining and Bayesian approaches; sequential Monte Carlo methods including particle filtering; applications in process control systems; motion control systems; robotics; aerospace systems; bioengineering and medical systems; physical measurement systems; automotive systems; econometrics; transportation and communication systems. Provides the latest research on System Identification. Contains contributions written by experts in the field. Part of the IFAC Proceedings Series, which provides a comprehensive overview of the major topics in control engineering. *Dynamic Programming for Impulse Feedback and Fast Controls* Alexander B. Kurzhanski, Alexander N. Daryin, 2019-03-29. *Dynamic Programming for Impulse Feedback and Fast Controls* offers a description of feedback control in the class of impulsive inputs. This book deals with the problem of closed loop impulse control based on generalization of dynamic programming techniques in the form of

variational inequalities of the Hamilton Jacobi Bellman type It provides exercises and examples in relation to software such as techniques for regularization of ill posed problems It also gives an introduction to applications such as hybrid dynamics control in arbitrary small time and discontinuous trajectories This book walks the readers through the design and description of feedback solutions for impulse controls the explanation of impulses of higher order that are derivatives of delta functions the description of their physically realizable approximations the fast controls and their approximations the treatment of uncertainty in impulse control and the applications of impulse feedback Of interest to both academics and graduate students in the field of control theory and applications the book also protects users from common errors such as inappropriate solution attempts by indicating Hamiltonian techniques for hybrid systems with resets
