Introduction

This paper aims at discussing the possible mobile technologies that can be used to scale the network at hand. It is a fact that the network in question already exists and what is required is to design or model how it will be integrated using wireless mobile networks. Scalability is a key factor in any network design because it determines the possibility of the designed network to be upgraded in future without inconveniencing the design.

A scalable network means that the network can be upgraded without making too much interference to it. Wireless networks refers to interconnection of computers and other electronic devices with a media that is wireless. This means that the interconnection between the nodes is implemented with a media that is not physical as opposed to wired media such as twisted pair. To be specific the media used is known as electromagnetic waves. Wireless WAN is the most preferred type of wireless connection (Kahneman, 1982). This is because its signal covers a wide area and is suitable for linking remote areas.

The emerging of wireless mobile network brought about greater changes to the world of networking. This is because it's now possible to connect to a network with a mobile device. One no longer needs to be in a fixed location to connect to the network. This type of network is also inexpensive to install and takes much lesser time as opposed to wired network. It is also the most preferred and easy to install type of network in remote and developing locations.

Glisic, Pentti A. Leppänen, 2013-03-14 In Time Division Multiple Access TDMA within a given time frame a particular user is allowed to transmit within a given time slot This technique is used in most of the second generation digital mobile communication systems In Europe the system is known as GSM in USA as DAMPS and in Japan as MPT In Code Division Multiple Access CDMA every user is using a distinct code so that it can occupy the same frequency bandwidth at the same time with other users and still can be separated on the basis of low correlation between the codes These systems like IS 95 in the USA are also developed and standardized within the second generation of the mobile communication systems CDMA systems within a cellular network can provide higher capacity and for this reason they become more and more attractive At this moment it seems that both TDMA and CDMA remain viable candidates for application in future systems Wireless Communications TDMA versus CDMA provides enough information for correct understanding of the arguments in favour of one or other multiple access technique The final decision about which of the two techniques should be employed will depend not only on technical arguments but also on the amount of new investments needed and compatibility with previous systems and their infrastructures Wireless Communications TDMA versus CDMA comprises a collection of specially written contributions from the most prominent specialists in wireless

communications in the world today and presents the major up to date issues in this field The material is grouped into four chapters Communication theory covering coding and modulation Wireless communications Antenna Propagation and Advanced Systems Technology The book describes clearly the issues and presents the information in such a way that informed decisions about third generation wireless systems can be taken It is essential reading for all researchers engineers and managers working in the field of Wireless Communications
