ELECTRICAL EQUIPMENT

BATTERY

HOW IT WORKS

The battery is made of groups of positive and groups of negative plates separated by insulating grids made of plastic.

All plates are put into an electrolyte solution of sulphuric acid and distilled water inside a plastic case. The battery is given an electrical charge by connecting an external current source to the terminals. The current flows from positive to negative. The positive plates change to lead peroxide and the negative change to spongy lead.

The battery keeps the charge in storage until needed. There will be a gradual loss of charge if the battery is not used. Overcharge damage will occur if the battery is kept in storage and not given a charge.

When an electrical circuit is connected to the battery, an electric current flows from the battery. The current flows in the opposite direction to the charging current.

There is a voltage rise in the battery between the discharging and the charging lead wires.

While the battery is discharging, the electrolyte is diluted, a deposit of sulphate on the plates. The density of the electrolyte decreases and the battery voltage is reduced.

The battery must be given an electrical charge again to return the battery to a full charge. This is done by the generator or alternator while on the move.

The battery is also given a charge from an external source, when the charge condition is less than 70%.

FAULT FINDING

Equipment Needed

- Hydrometer
- 12V battery test equipment (0-50 volts)
- 12V charging and discharging (0-50 amperes)
- Hydrometer
- Atmospheric, in good condition

TEST 1: Specific Gravity

Use an hydrometer to check the specific gravity of the electrolyte in each cell. The test will tell you how much more or less electrolyte is in each cell. The amount must be just about right.

Temperature correction

For every 10° Celsius less than 10° Celsius, subtract 0.005 from the specific gravity shown on the hydrometer.

For every 10° Celsius more than 10° Celsius, add 0.005 to the specific gravity shown.

For every 10° Fahrenheit less than 60° Fahrenheit, subtract 0.004 from the specific gravity shown.

For every 10° Fahrenheit more than 60° Fahrenheit, add 0.004 to the specific gravity shown.

Example

Specific gravity corrected to 10° Celsius (60° Fahrenheit) for temperature less than 10° Celsius (50° Fahrenheit):

- Full charge 1.260-1.280
- 75% charge 1.230-1.250
- Discharged 1.190-1.210

For temperature more than 10° Celsius (50° Fahrenheit):

- Full charge 1.250-1.270
- 75% charge 1.220-1.240
- Discharged 1.180-1.200

The battery must be given a charge if less than 70% charge is shown. If there is a difference of more than 0.040 between cells, make a note and check all the battery.
