Modeling Time in Computing Carlo A. Furia, Dino Mandrioli, Angelo Morzenti, Matteo Rossi, 2012-10-19 Models that include a notion of time are ubiquitous in disciplines such as the natural sciences, engineering, philosophy and linguistics but in computing the abstractions provided by the traditional models are problematic and the discipline has spawned many novel models. This book is a systematic, thorough presentation of the results of several decades of research on developing, analyzing and applying time models to computing and engineering. After an opening motivation introducing the topics, structure and goals, the authors introduce the notions of formalism and model in general terms along with some of their fundamental classification criteria. In doing so, they present the fundamentals of propositional and predicate logic and essential issues that arise when modeling time across all types of system. Part I is a summary of the models that are traditional in engineering and the natural sciences, including fundamental computer science, dynamical systems and control theory, hardware design and software algorithmic and complexity analysis. Part II covers advanced and specialized formalisms dealing with time modeling in heterogeneous, software-intensive systems, formalisms that share finite state machines as common ancestors: Petri nets in many variants, notations based on mathematical logic such as temporal logic, process algebras and dual language approaches combining two notations with different characteristics to model and verify complex systems, e.g. model checking frameworks. Finally, the book concludes with summarizing remarks and hints towards future developments and open challenges. The

presentation uses a rigorous yet not overly technical style appropriate for readers with heterogeneous backgrounds and each chapter is supplemented with detailed bibliographic remarks and carefully chosen exercises of varying difficulty and scope. The book is aimed at graduate students and researchers in computer science while researchers and practitioners in other scientific and engineering disciplines interested in time modeling with a computational flavor will also find the book of value and the comparative and conceptual approach makes this a valuable introduction for non experts. The authors assume a basic knowledge of calculus probability theory algorithms and programming while a more advanced knowledge of automata formal languages and mathematical logic is useful.
