

SECTION E: Big data refers to huge collections of data that are difficult to process, analyze, and manage using conventional data tools. It is a core component of the platform, which also includes cloud computing, devices, and social networking. The five Vs of big data are high volume, high , diversified variety, unknown veracity, and low- value. Although SQL and relational databases can be used for big datasets, a collection of alternative tools referred to as has become popular. These tools work well when databases scale (horizontally) and when databases are broken into subsets called . Modern database tools also handle

scaling as devices are added when additional capacity is required. NoSQL tools are sometimes said to create databases, but they usually have some type of structure, though it may be more flexible than the relational model. A key- data model provides each data element with a key. A(n) -oriented data model makes it easy to access data stored in similar fields, rather than in individual records. Two very popular NoSQL tools include , which is a big data file system, and , which sends processing logic to the data, rather than bringing the data to the computer that performs the processing.

Pulmonary Rehabilitation Claudio Donner, Nicolino Ambrosino, Roger S. Goldstein, 2020-07-14 Pulmonary rehabilitation programmes are a fundamental part of the clinical management of patients with chronic respiratory diseases. This comprehensive reference book places pulmonary rehabilitation within the wider framework of respiratory disease. Now in six parts it includes new sections on the development of PR as a discipline, global perspectives on quality control, new chapters on early PR post exacerbation and personalized rehabilitation, innovative approaches to exercise PR in interstitial lung disease and lung transplantation and the latest research into the application of music, dance and yoga. Key Features: Global contributions compare practice around the world where differences have developed. New six Part structure covers new approaches to exercise testing, interstitial lung diseases and other diseases and add on interventions drawing on new technologies. Contains recommendations of the large collaborative ERS/ATS task forces on guidelines for PR as well as suggested policies for its implementation and use. Covers the important topic of balance impairment as a focus of rehabilitation for the at risk patient and a new chapter on monitoring physical activity. The voices of patients and caregivers describe the impact of chronic respiratory disease on their lives. Features an exclusive chapter on COVID 19 that discusses the short and long term pathophysiological consequences, provides information about the potential role of physiotherapy in the management of hospitalized patients with confirmed or suspected COVID 19 and details on who, where and how to deliver programs to COVID 19 and non COVID 19 patients in the lockdown and post lockdown era.

Merging Symbolic and Data-Driven AI for Robot Autonomy Nikos Katzouris, Simona Perri, Mohan Sridharan, Daniele Meli, 2025-09-08 Robots are increasingly being deployed to assist and collaborate with humans in many applications such as medicine, navigation and industrial automation. To truly collaborate with humans in complex environments, robots require advanced cognitive capabilities including the ability to reason with domain specific commonsense knowledge and the noise observations obtained in the presence of partial observability and non deterministic action outcomes. Research in Artificial Intelligence (AI) has resulted in sophisticated symbolic formalisms that use temporal and logic relations to represent commonsense domain knowledge as well as probabilistic data driven frameworks that quantitatively represent uncertainty in the decision making process of robot systems. Stand alone symbolic or stochastic AI methods have limitations when applied to robots in complex scenarios. Symbolic AI methods reason with relational descriptions of the attributes of the domain and the robot to guide the robot's behavior. It is however often computationally intractable to use these methods to reason about uncertainty quantitatively or to operate at the level of granularity required for precise interaction with objects in complex domains. Probabilistic and data driven AI methods on the other hand elegantly represent uncertainty quantitatively and provide mechanisms for reasoning and acting at the level of granularity required for interaction with the physical worlds. These methods however offer limited expressiveness for complex cognitive concepts.
