## Introduction

Number theory, one of the most beautiful and fascinating areas of mathematics, has made major progress over the last decades, and is still developing rapidly. In the beginning of the foreword to his book *Algebraic Number Theory*, J. Neukirch wrote

„Die Zahlentheorie nimmt unter den mathematischen Disziplinen eine ähnlich idealisierte Stellung ein wie die Mathematik selbst unter den anderen Wissenschaften.“<sup>1</sup>

Although the joint authors of the present book wish to reiterate this statement, we wish to stress also that number theory owes much of its current strong development to its interaction with almost all other mathematical fields. In particular, the geometric (and consequent functorial) point of view of arithmetic geometry uses techniques from, and is inspired by, analysis, geometry, group theory and algebraic topology. This interaction had already started in the 1950s with the introduction of group cohomology to local and global class field theory, which led to a substantial simplification and unification of this area.

The aim of the present volume is to provide a textbook for students, as well as a reference book for the working mathematician on cohomological topics in number theory. Its main subject is Galois modules over local and global fields, objects which are typically associated to arithmetic schemes. In view of the enormous quantity of material, we were forced to restrict the subject matter in some way. In order to keep the book at a reasonable length, we have therefore decided to restrict attention to the case of dimension less than or equal to one, i.e. to the global fields themselves, and the various subfields contained in them. Central and frequently used theorems such as the global duality theorem of G. Poitou and J. Tate, as well as results such as the theorem of T. K. Ueno on the vanishing of cohomology groups of Galois modules over

Borovoi, 1998 In this volume a new function  $H^2(\text{ab } K/G)$  of abelian Galois cohomology is introduced from the category of connected reductive groups  $G$  over a field  $K$  of characteristic 0 to the category of abelian groups The abelian Galois cohomology and the abelianization map  $\text{ab}_1 H^1(K/G)$  are used to give a functorial almost explicit description of the usual Galois cohomology set  $H^1(K/G)$  when  $K$  is a number field *Class Field Theory* Georges Gras, 2005-02-16 Global class

field theory is a major achievement of algebraic number theory based on the functorial properties of the reciprocity map and the existence theorem This book explores the consequences and the practical use of these results in detailed studies and illustrations of classical subjects In the corrected second printing 2005 the author improves many details all through the book Galois Cohomology and Number Field Counting Brandon Alberts, 2018 Arithmetic Statistics is the study of how

arithmetic objects are distributed One of the most popular examples in this subject are number field counting problems Initially discussed by Cohen Lenstra and Malle there are now a variety of conjectural heuristics and solutions describing the distribution of number fields with prescribed Galois group local behavior degree etc when ordered by their discriminant Despite the wealth of computational and theoretical evidence very few cases have been proven This dissertation details the author's work on proving new cases of a few number field counting problems Namely we prove some new cases of Wood's nonabelian Cohen Lenstra heuristics and set the stage to prove more and we prove new upper bounds for the weak form of Malle's conjecture which agree with Malle's predicted bounds conditional on the conjectural growth of ell torsion in class groups of number fields with fixed degree *Class Field Theory* Emil Artin, John Torrence Tate, 1968 This classic book

originally published in 1968 is based on notes of a year long seminar the authors ran at Princeton University The primary

goal of the book was to give a rather complete presentation of algebraic aspects of global class field theory. In this revised edition two mathematical additions complementing the exposition of the original text are made. The new edition also contains several new footnotes, additional references and historical comments.

**Algebraic Number Theory** H. Koch, Helmut Koch, 1997-09-12. From the reviews of the first printing published as Volume 62 of the Encyclopaedia of Mathematical Sciences. The author succeeded in an excellent way to describe the various points of view under which Class Field Theory can be seen. In any case the author succeeded to write a very readable book on these difficult themes. Monatshefte fuer Mathematik 1994. Koch's book is written mostly for non specialists. It is an up to date account of the subject dealing with mostly general questions. Special results appear only as illustrating examples for the general features of the theory. It is supposed that the reader has good general background in the fields of modern abstract algebra and elementary number theory. We recommend this volume mainly to graduate students and research mathematicians. Acta Scientiarum Mathematicarum 1993.
