**Thông báo sách mới ,2009      3D Multiscale Physiological Human** Nadia Magnenat-Thalmann,Osman Ratib,Hon Fai Choi,2013-12-23 3D Multiscale Physiological Human aims to promote scientific exchange by bringing together overviews and examples of recent scientific and technological advancements across a wide range of research disciplines As a result the variety in methodologies and knowledge paradigms are contrasted revealing potential gaps and opportunities for integration Chapters have been contributed by selected authors in the relevant domains of tissue engineering medical image acquisition and processing visualization modeling computer aided diagnosis and knowledge management The multi scale and multi disciplinary research aspects of articulations in humans are highlighted with a particular emphasis on medical diagnosis and treatment of musculoskeletal diseases and related disorders The need for multi scale modalities and multi disciplinary research is an emerging paradigm in the search for a better biological and medical understanding of the human musculoskeletal system This is particularly motivated by the increasing socio economic burden of disability and musculoskeletal diseases especially in the increasing population of elderly people Human movement is generated through a complex web of interactions between embedded physiological systems on different spatiotemporal scales ranging from the molecular to the organ level Much research is dedicated to the understanding of each of these systems using methods and modalities tailored for each scale Nevertheless combining knowledge from different perspectives opens new venues of scientific thinking and stimulates innovation Integration of this mosaic of multifaceted data across multiple scales and modalities requires further exploration of methods in simulations and visualization to obtain a comprehensive synthesis However this integrative approach cannot be achieved without a broad appreciation for the multiple research disciplines involved

**Forensic Facial Reconstruction Using 3-D Computer Graphics** Maria Vanezis,2008 This thesis is concerned with computerised forensic 3 D facial reconstruction as a means of identification and involves the restoration of the face on the skull in an attempt to achieve a close likeness of the individual when alive The reconstruction process begins with the biological identification of the skeletal remains age sex ancestry and build Facial reconstruction is then carried out and essentially works by building the face up from the skull using soft tissue thicknesses at

specific locations from existing data. However, it is used as a last resort on skeletonised badly decomposed or mutilated corpses when no other information is available; even then it is only accepted as corroborative evidence in court. It is performed in the hope that it may stimulate recognition and consequently narrow the field of identification, allowing other tests to be carried out such as radiographic and/or dental comparisons, DNA analysis or other means to establish positive identification. The advantages of the computerised method over the manual clay reconstruction are speed, rapid editing capability, production of images that can be stored and reconstructions repeated at any time if required. Furthermore, in many cases the original skull instead of a cast or model may be used for reconstruction because the 3-D computerised procedure is rapid and non-invasive. However, the most significant advantage of this technique with regard to the aims and objectives of the thesis is that a number of alternative reconstructions may be produced sequentially for the same skull by using different facial templates from the database that meet the anthropological/biological criteria of the skull. The issues addressed by the study and therefore its main aims are: a) evaluation and b) improvement of the reliability of facial reconstruction using 3-D computer graphics.
