Cell Immortalization Progress In Molecular And Subcellular Biology V 24:

Cell Immortalization Alvaro Macieira-Coelho, 2013-04-17 The problem of the long term proliferation of cells is a seminal one It has always been a hot subject in biology a source of far reaching hypotheses even more so now when explanations for the mechanisms of cell proliferative mortality or immortality seem within our reach A question which is still debated is whether an infinite division potential can be a normal trait or is always the result of modifications leading to abnormal cell growth and escape from homeostasis In general investigators have been advocates of one of the two extremes universal limited or unlimited normal proliferative potential Since the long term proliferative potential of cells concerns regulation of development regeneration of tissues and homeostatic control of cell growth in brief survival of living organisms and since the regulation of these processes is so different along the evolutionary scale it is not surprising that there does not seem to be any universal trait The question of whether cells are endowed with finite or infinite proliferative phenotypes has to be seen using the perspective of comparative biology

Aging Shamim I. Ahmad, 2017-10-30 This book is a detailed and comprehensive synthesis of the scientific study of aging Dozens of contributions from leading scholars review various theories of aging and molecular cellular biochemical and microbial aspects of aging among just a few of the topics included Authoritative wide ranging and thorough this book will act as a source for experimental design a comprehensive description of age related diseases and provide information of the latest molecular theories underlying their causes Additionally it will target industries involved in developing anti aging drugs post graduate medical students and university libraries

Biology of Aging Alvaro Macieira-Coelho, 2012-12-06 The survival of the human species has improved significantly in modern times During the last century the mean survival of human populations in developed countries has increased more than during the preceding 5000 years This improvement in survival was accompanied by an increase in the number of active years In other words the increase in mean life span was accompanied by an increase in health span This is now accentuated by progress in medicine reducing the impact of physiologic events such as menopause and of pathological processes such as atherosclerosis Up to now research on aging whether theoretical or experimental has not contributed to improvement in human survival Actually there is a striking contrast between these significant modifications in survival and the present knowledge of the mechanisms of human aging Revealed by this state of affairs are the profound disagreements between gerontologists in regard to the way of looking at the aging process The definition of aging itself is difficult to begin with because of the variability of how it occurs in different organisms
