

Dissection 101:

The Clam

➤ Lesson Plan: Clam Dissection

Background: The clam is an invertebrate in the phylum Mollusca; it is a bivalve, having two shells connected by a hinge. The shells provide protection for the clam and are opened and closed by two adductor muscles located on either side of the hinge. The hinge is located on the dorsal side of the clam next to a structure/location called the umbo. The umbo is circular in shape and is the oldest section of the shell. Many times the umbo appears worn with the dark outer layers of the shell removed, exposing the iridescent nacre/mother of pearl. Additional rings are produced by the mantle of the clam as it grows.

The clam has a complete digestive system with a mouth and anus. Clams are filter feeders, sifting through water and sediment on the bottom of streams, rivers and lakes. They separate the organic material
