Dagar, P.C. Sharma, D.K. Sharma, A.K. Singh, 2016-08-10 The land degradation due to salinity and waterlogging is a global phenomenon afflicting about one billion hectares within the sovereign borders of at least 75 countries Besides staring at the food security it has far reaching and unacceptable socio economic consequences since a large proportion of this land is inhabited by smallholder farmers The anthropogenic

environmental changes and the climate change are further adding to the problem of salinity and waterlogging The phenomenon of sea level rise will bring more areas under waterlogged salinity due to inundation by sea water Thus dealing with the salinity in reality is becoming a highly onerous task owing to its complex nature uncertainty and differential temporal and spatial impacts Nevertheless with the need to provide more food feed fuel fodder and fiber to the expanding population and non availability of new productive land there is a need for productivity enhancement of these lands In fact the salt affected and waterlogged lands cannot be neglected since huge investments have been made throughout the world in the development of irrigation and drainage infrastructure The social economic and environmental costs being high for the on and off farm reclamation techniques saline agriculture including agroforestry inculcated with modern innovative techniques is now emerging as a potential tool not only for arresting salinity and waterlogging but for other environmental services like mitigate climate change sequester carbon and biodiversity restoration This publication attempts to address a wide range of issues principles and practices related to the salinity involved in rehabilitation of waterlogged saline soils and judicious use of saline waters including sea water Many of the site specific case studies typical to the saline environment including coastal ecologies sustaining productivity rendering environmental services conserving biodiversity and mitigating climate change have been described in detail Written by leading researchers and experts of their own fields the book is a must not only for salinity experts but also for policy makers environmentalists students and educationists alike More importantly it contributes to reversing the salinity trends and teaches to sustain with salinity ensuring the livelihood of resource poor farming families leaving in harsh ecologies including coastal areas which are more vulnerable to climate change

Guidelines for brackish water use for agricultural production in the Near East and North Africa region Food and Agriculture Organization of the United Nations, Arab Water Council, 2023-01-26. Water scarcity is one of the major challenges in the 19 countries of the Near East and North Africa (NENA) region. The lack of water is affecting important irrigated areas, limiting the increase of food production needed to address the growing demand due to population growth. In most countries of the NENA region, the need to use non-conventional water resources including brackish water is well recognized. Brackish water is loosely defined as water that is more saline than freshwater but less saline than seawater. It covers a large range of salinity levels from 500 to 30 000 mg/l of total dissolved solids (TDS). Despite the presence of large amounts of brackish water and its potential for use in growing a number of crops, it is only used in limited amounts for irrigation. The successful use of brackish water for irrigation requires a basic understanding of scientific principles affecting the interactions among the climate, the applied water, the soil, the crop and the environment. Equally important is the application of suitable technology and management practices that will facilitate the optional use of this poor quality water. The successful use of brackish water requires a higher level of management and likely the adoption of new irrigation management practices. Because climate, water quality, soil type and crop tolerance to salinity vary from location to location, guidelines with some degree of site-specific flexibility must be developed.

Turfgrass Water Conservation Stephen T. Cockerham, Bernd Leinauer, 2011-01-01. Water is an increasingly valuable and limited resource, often perceived as being wasted on turfgrass. This much anticipated second edition brings clear, current, science-based information on turfgrass management and water conservation to turf managers and researchers alike. Inside you'll find a look at the current understanding of water use as well as new technologies being researched to reduce water use by turfgrass. Attention is paid to water quality and turfgrass as a key part of the urban environment; how integrating turfgrass with other landscape uses of water can be part of a conservation plan; and how various water qualities including reclaimed water can be part of a management plan. Chapters also cover advances in drought, heat and salinity stress tolerance; the role of water in modified root zone media and native soils; water management technologies; considerations for construction and management of urban green spaces including parks and golf courses; water depletion; pesticide and nutrient runoff. A chapter summarizing the

practical application of the science in each chapter rounds out the text presenting the information in an immediately useable format Includes 10 tables and figures 20 color photos a U S customary to metric conversion table and an 8 page glossary
