is especially suitable for undergraduates in the natural sciences and all branches of engineering who have some knowledge of computing basics and now need to understand and apply software design to tasks like data analysis simulation signal processing or visualisation John Robinson introduces both software theory and its application to problem solving using a range of design principles applied to the creation of medium sized systems providing key methods and tools for designing reliable efficient maintainable programs The case studies are presented within scientific contexts to illustrate all aspects of the design process allowing students to relate theory to real world applications Core computing topics usually found in separate specialised texts presented to meet the specific requirements of science and engineering students Demonstrates good practice through applications case studies and worked examples based in real world contexts
