Implementing Full Duplexing for 5G David B. Cruickshank, 2020-05-31 This exciting new book examines the feasibility of using a method of doubling the capacity of cellular networks by simultaneously transmitting and receiving signals at the same frequency a process known as full duplexing FD To realize full duplexing changes in the hardware of the cell base stations relaying equipment hot spot access points and mobile phones are necessary to prevent the hardware's transmitters from interfering with their own receivers This requires looking at how to separate the strong transmitted signal from the very weak received signal a process requiring both hardware analog changes and more complex digital signal processing Different ways of achieving that goal are examined The book reviews the merits of hardware changes involving new duplexing components that may be different depending on the frequency band and cell hardware being used Developing full duplex FD systems in 5G LTE cellular communications and what can be achieved with ferrite based circulators in terms of size reduction and performance enhancement especially at millimetric frequencies is considered The relative merits of ferrite and non ferrite circulators are compared in terms of their fundamental materials and device technologies such as isolation insertion loss bandwidth and non linearity FD in the entire 5G cell is also examined and its resulting range of equipment and device communication This includes front hauling more sophisticated back and front hauling backhaul beam switching and cell extenders and relays all of which could involve FD
