Tips

- Take at least two views of each anatomic region—remember, you're capturing a three-dimensional object.
- Center the x-ray beam directly over the area of interest.
- Visualize how the image would look on a monitor. Move the patient and position the area of interest along the long axis of your collimated field, rather than rotating the extremities.

- Collimate to the area of interest to reduce scatter radiation and improve image quality.
- Be safer—always use protective lead gloves, aprons, and thyroid shields to protect yourself from scatter radiation; stay as far away as possible from the primary x-ray beam; and use positioning devices.
- Use a well-defined system of exposure determination, such as a technique chart based on patient characteristics, for accurate, repeatable, and optimal exposures. Include laterality markers.

Thorax

Lateral thorax

Scapulum and thoracic spine must both be in same plane. Extend thoracic extremities. Extend front limbs, but do not rotate patient. If lateral collimation available, top of last rib. Image posterior of peak inspiration.

Abdomen

Lateral abdomen

Position animal as for lateral thorax, but center on middle of torso ribs. Exception: For cats and brachycephals, center 1 inch posterior last rib.
