Computational Intelligence In Integrated Airline Scheduling Studies In Computational Intelligence:

Computational Intelligence in Integrated Airline Scheduling Tobias Grosche, 2008-12-23 An airline schedule represents the central planning element of each airline. In general, the objective of airline schedule optimization is to find the airline schedule that maximizes operating profit. This planning task is not only the most important but also the most complex task an airline is confronted with. Until now, this task is performed by dividing the overall planning problem into smaller and less complex subproblems that are solved separately in a sequence. However, this procedure is only of minor capability to deal with interdependencies between the subproblems, resulting in less profitable schedules than those being possible with an approach solving the airline schedule optimization problem in one step. In this work, two planning approaches for integrated airline scheduling are presented. One approach follows the traditional sequential approach: existing models from literature for individual subproblems are implemented and enhanced in an overall iterative routine, allowing to construct airline schedules from scratch. The other planning approach represents a truly simultaneous airline scheduling using metaheuristics: airline schedules are processed and optimized at once without a separation into different optimization steps for its subproblems.

Computational Intelligence in Integrated Airline Scheduling Tobias Grosche, 2009-02-26 In this text, two planning approaches for integrated airline scheduling are presented. One follows the traditional sequential approach, and the other uses metaheuristics to offer a truly simultaneous approach to airline scheduling. *Handbook of Heuristics* Rafael Martí, Panos M. Pardalos, Mauricio G.C. Resende, 2025-11-17 The handbook of heuristics consists of five main parts: search strategies, local search, metaheuristics, analysis and implementations, and applications. They cover from search methods and methodological aspects such as metaheuristics, the exciting field in which mathematical programming is combined with heuristics to applications that provide the practitioner with a description of some relevant optimization issues in a number of specific application areas such as scheduling, vehicle routing, or network optimization. The first edition of the Handbook of Heuristics was published in 2018 and contained 47 chapters. In this second edition, the authors revised 30 of them to include new developments in the area that appeared in the last few years. In particular, the reader may find 14 chapters in search strategies, including a new chapter on deep learning; 4 in local search; 14 in metaheuristics; 5 in analysis and implementations; and 24 in applications. The inclusion of 14 new chapters makes this second edition even more comprehensive, totaling 61 chapters.

Tourism, Transport and Travel Management M.R. Dileep, 2019-03-04 The terms travel and tourism are often used interchangeably in tourism literature. This comprehensive textbook provides students with essential knowledge of the intricate relationship existing between travel, transport, and tourism. The book analyses the structure, functions, activities, strategies, and practices of each of the sectors in the travel industry, such as airlines, airports, tour operators, travel agencies, and cruises. It is structured into six parts covering all modes of transport: air, land, and water; travel intermediation; the tour operation; business; and impacts and prospects for the future. International case studies are integrated throughout to

showcase practical realities and challenges in the travel industry and to aid students learning and understanding Written in an accessible and engaging style this is an invaluable resource for students of tourism hospitality transport and travel management courses

Big Data to Improve Strategic Network Planning in Airlines Maximilian Schosser, 2019-09-05 Big data has become an important success driver in airline network planning Maximilian Schosser explores the status quo of network planning across a case study group consisting of nine airlines representing different business models The author describes 23 big data opportunities for airline network planning and evaluates them based on their specific value contribution for airline network planning Subsequently he develops a financial evaluation methodology for big data opportunities based on key performance indicators for airline network planning departments

Advances in Computational Intelligence in Transport, Logistics, and Supply Chain Management Andreas Fink, Franz Rothlauf, 2008-09-08 Logistics and supply chain management deal with managing the flow of goods or services within a company from suppliers to customers and along a supply chain where companies act as suppliers as well as customers As transportation is at the heart of logistics the design of traffic and transportation networks combined with the routing of vehicles and goods on the networks are important and demanding planning tasks The influence of transport logistics and supply chain management on the modern economy and society has been growing steadily over the last few decades The worldwide division of labor the concentration of distributed production centers and the increased mobility of individuals lead to an increased demand for efficient solutions to logistics and supply chain management problems On the company level efficient and effective logistics and supply chain management are of critical importance for a company's success and its competitive advantage Proper performance of the logistics functions can contribute both to lower costs and to enhanced customer service

Soft Computing for Data Mining Applications K. R. Venugopal, K.G. Srinivasa, L. M. Patnaik, 2009-03-11

The authors have consolidated their research work in this volume titled *Soft Computing for Data Mining Applications*. The monograph gives an insight into the research in the fields of Data Mining in combination with Soft Computing methodologies. In these days the data continues to grow potentially. Much of the data is implicitly or explicitly imprecise. Database discovery seeks to discover noteworthy unrecognized associations between the data items in the existing database. The potential of discovery comes from the realization that alternate contexts may reveal additional valuable information. The rate at which the data is stored is growing at a phenomenal rate. As a result traditional ad hoc mixtures of statistical techniques and data management tools are no longer adequate for analyzing this vast collection of data. Several domains where large volumes of data are stored in centralized or distributed databases include applications like e-commerce, bioinformatics, computer security, Web intelligence, intelligent learning, database systems, finance, marketing, healthcare, telecommunications and other fields. Efficient tools and algorithms for knowledge discovery in large data sets have been devised during the recent years. These methods exploit the capability of computers to search huge amounts of data in a fast and effective manner. However the data to be analyzed is imprecise and affected with uncertainty. In the case of heterogeneous data sources such as text and video the data might moreover be ambiguous and partly conflicting. Besides patterns and relationships of interest are usually approximate. Thus in order to make the information mining process more robust it requires tolerance toward imprecision, uncertainty and exceptions.
