Hutchinson, 2025-07-06 The climate is changing but is factually proven in the big picture to be caused by astrophysical geophysical and natural regional causes and little by Man created greenhouse gas emissions Environmental scientists use of a one size fits all average global temperature land and oceans surfaces for the planet is factually disproven in this book as being a valid indicator of the climate affecting all regions of the planet Humans must survive seasonal extremes of hot and cold temperature in a region not a benign annual average global temperature The over exaggerations in a hastily created hypothesis that Man burning fossil fuels creates greenhouse gas emissions which are the dominant cause for adverse climate change and at an ominous crisis rate are fear mongering and of devious intent The hypothesis is disproven when credible scientific databases of dynamic factors affecting the climate are factually considered and logically interpreted for their causal

effects This book has factually shown that the average global temperature and one size fits all goals of the environmental science groups especially those in the United Nations Intergovernmental Panel on Climate Change IPCC to limit the change in average global temperature to not exceed two degrees Centigrade by 2035 and achieve net zero greenhouse gas emissions by 2050 are baseless Even if fully achieved the present combat of climate change and reduction of greenhouse gas emissions will bring little if any change in the surface temperature or climate in most regions The goal should be to protect human safety health comfort and safe transportation not to preserve the environment at any cost to the human population
